A stepper motor or step motor or stepping motor is a brushless DC electric motor that

divides a full rotation into a number of equal steps. The motor's position can then be commanded to move and hold at one of these steps without any position sensor for feedback (an open-loop controller), as long as the motor is carefully sized to the application in respect to torque and speed.

There are two key differences between 2-phase and 5-phase motors. The first is

mechanical. A step motor consists of basically two parts, a stator and a rotor. The rotor in turn is made up of three components; rotor cup 1, rotor cup 2 and a permanent magnet. In a 2-phase motor the stator is made up of 8 magnetic poles with small teeth, while the 5-phase motor stator is made up of 10 magnetic poles.

~~Stepper Motors 2 Phase vs. 5 Phase Hybrid Stepper Motor ...~~

The step motors are mostly two phase motors. These can be unipolar or bipolar. In unipolar step motor there are two winding per phase. The two winding to a pole may have one lead common i.e. centre tapped.

Whereas PM motors are basically 2-phase machines, VR motors require at least 3 phases. Most VR stepper motors have 3 or 4 phases although 5-phase VR motors are

available. In a VR stepper motor, the field moves at a different rate than the rotor. Note that Phase A coil has two south poles and no north poles for a flux return path.
