A Novel and Efficient Total Synthesis of Cephalotaxine | Organic Letters. Total synthesis of cephalotaxine (CET), the parent member of a class of structurally unique antileukemia Cephalotaxus alkaloids, was accomplished on the basis of a conceptually novel strategy featuring transannular reductive skeletal rearrangements as the key transformations for the construction of the pentacyclic ring skeleton of CET.

meso-Tetra(n-hexyloxycarbonyl)porphyrin was found to be converted into porphine, the mother compound of porphyrins, in a 77% yield when heated in aqueous sulfuric acid at 180 °C over 30 min under an inert atmosphere.The observation demonstrates that the substituted porphyrin serves as a novel and useful precursor for porphine.

A new and highly versatile source of difluorocarbene is reported. Trimethylsilyl fluorosulfonyldifluoroacetate (TFDA) undergoes decomposition in the presence of catalytic fluoride to form difluorocarbene under conditions that allow its addition to relatively electron deficient alkenes in high yield. For example, unprecedented CF2: addition to n-butyl acrylate proceeded in 73% yield.

To sum up, we developed a novel efficient chemoenzymatic synthesis method of D-glutamine using DL-glutamic acid as the raw material. This was the first report that D-glutamine could be prepared by the resolution of DL-glutamine with recombinant DmpA which was expressed in E. coli. Meanwhile, it was also the first time for DmpA to be recruited in the synthesis of D-amino acids.
