access control (RBAC) restricts network access based on a person's role within an organization and has become one of the main methods for advanced access control. The roles in RBAC refer to the levels of access that employees have to the network.

What is Role-Based Access Control (RBAC)? Examples ...

The Role-Based Access Control (RBAC) plugin gives a CloudBees CI administrator the ability to define various security roles that will apply to the system they administer. Once roles have been defined, the administrator can assign those roles to groups of users. The assignment of roles can take place either at the global level, or limited to specific objects within the system.

The biggest shortcoming of the role-based access control in the Admin Center is that it is currently not possible to define your own roles and assign granular rights to them. In addition to the limited range of functions and the poor performance, the rudimentary rights management also considerably limits the benefits of the WAC tools.

By default, Azure roles and Azure AD roles do not span Azure and Azure AD. However, if a Global Administrator elevates their access by choosing the Access management for Azure resources switch in the Azure portal, the Global Administrator will be granted the User Access Administrator role (an Azure role) on all subscriptions for a particular tenant. The User Access Administrator role enables the user to grant other users access to Azure resources.

Classic subscription administrator roles, Azure roles, and ...

To enable support for role-based access control on a single machine, follow these steps: Open Windows Admin Center and connect to the machine you wish to configure with role-based access control using an account with local administrator privileges on the target machine.
