Biological evolution, simply put, is descent with modification. This definition encompasses small-scale evolution (changes in gene – or more precisely and technically, allele – frequency in a population from one generation to the next) and large-scale evolution (the descent of different species from a common ancestor over many generations). Evolution helps us to understand the history of life.

Mark Ridley, a professor of zoology at Oxford University, wryly noted that “no real evolutionist, whether gradualist or punctuationalist, uses the fossil record as evidence in favor of the theory of evolution as opposed to special creation” (1981, 831). Evolution is a story of “gaps,” not “links”—of “questions,” not “answers.”
