5. Application of ODEs: Series RL Circuit

A differentiating circuit is a simple series RC circuit where the output is taken across the resistor R . The circuit is suitably designed so that the output is proportional to the derivative of the input. Thus if a d.c. or constant input is applied to such a circuit, the output will be zero. Fig.1 shows a typical differentiating circuit.

Application Of Differentiation Electrical Circuits

This question asks students to relate the concept of time-differentiation to physical motion, as well as giving them a very practical example of how a passive differentiator circuit could be used. In reality, one must be very careful to use differentiator circuits for real-world signals because differentiators tend to amplify high-frequency noise.
