Avian malaria is a parasitic disease of birds, caused by parasite species belonging to the genera Plasmodium and Hemoproteus. The disease is transmitted by a dipteran vector including mosquitoes in the case of Plasmodium parasites and biting midges for Hemoproteus. The range of symptoms and effects of the parasite on its bird

Subregion hosts is very wide, from asymptomatic cases to drastic population declines due to the disease, as is the case of the Hawaiian honeycreepers. The diversity of parasites is l

Avian malaria - Wikipedia

Here we document a significant increase in prevalence of avian malaria at the same high elevation site during 2001–2002. The increase was associated with warmer temperatures than during the early period, and with mosquito breeding on site. It is an early warning of what might be expected from climate warming.

**Subregion**  
Avian malaria, transmitted by *Culex quinquefasciatus* mosquitoes in the Hawaiian Islands, has been a primary contributor to population range limitations, declines, and extinctions for many endemic Hawaiian honeycreepers. Avian malaria is strongly influenced by climate; therefore, predicted future changes are expected to expand transmission into higher elevations and intensify and lengthen existing transmission periods at lower elevations, leading to further population declines and potential ...

(PDF) AVIAN MALARIA -  
ResearchGate

The avian malarias in the genus *Plasmodium* are all mosquito-borne. *Plasmodium* spp. that infect birds have been important research models for studying malaria. Indeed, the original observations by Ronald Ross on the role of mosquitoes as malaria vectors were made with bird malaria. Currently, about 30 species of avian *Plasmodium* are recognized. However, the taxonomic status of some species is uncertain and others remain to be described.

Subregion past 200 years. In the forests of Kona, there are almost no native birds present; nonnative species have completely taken over this habitat.

Avian Malaria in Hawaiian Birds -  
microbewiki

Avian malaria, also called bird malaria, infectious disease of birds that is known particularly for its devastation of native bird populations on the Hawaiian Islands. It is similar to human malaria in that it is caused by single-celled protozoans of the genus *Plasmodium* and is transmitted through the bite of infected mosquitoes.

Avian Malaria in the Asian Tropical Subregion by Marshall ...  
The introduction of a mosquito vector, *Culex quinquefasciatus*, and two vector-borne avian diseases, avian malaria (*Plasmodium relictum*) and avian pox (*Avipoxvirus* spp.), have been implicated as important factors responsible for the drastic decline, limited altitudinal distribution, and extinction of native Hawaiian birds over the last century (Warner 1968, van Riper et al. 1986, 2002, Atkinson and Samuel 2010, Samuel et al. 2011).
