Chronic Kidney Disease, Dialysis, and Transplantation -

Chronic kidney disease (CKD) usually means that your kidneys do not work in the normal way. The kidneys then can't remove waste products from your body. Damage to the filter system can also allow blood and protein to leak into the urine. However the vast majority of people with CKD have no symptoms and do not need any specialist input.

Chronic kidney disease (CKD) | Kidney Care UK

CKD stage 5 is e GFR less than 15 ml/min, established kidney failure, when dialysis or a kidney transplant may be needed. Proteinuria. Leakage of protein into the urine increases the risk of any kidney disease. Everyone with CKD should therefore have a urine test to measure the amount of protein in the urine, and if this level is high, they will receive more careful treatment and possibly more extensive investigations.

Chronic kidney disease | National Kidney Federation

Chronic kidney disease (CKD) is defined as a reduction in kidney function or structural damage (or both) present for more than 3 months (NICE CG 182). CKD stage 5 (or G5 A1-3) is defined as a GFR less than 15 ml/min. It excludes individuals who temporarily drop below 15 ml/min (e.g. acute kidney injury oracute on chronic kidney disease)

Coronavirus (Covid-19) guidance for patients with kidney -

An alternative to dialysis for people with severely reduced kidney function is a kidney transplant. This is often the most effective treatment for advanced kidney disease, but it involves major surgery and taking medicines (immunosuppressants) for the rest of your life to stop your body attacking the donor organ.
