Both solutions have the same freezing point, boiling point, vapor pressure, and osmotic pressure because those colligative properties of a solution only depend on the number of dissolved particles. Other non-colligative properties including e.g. viscosity, surface tension, and solubility are different. 4.

Among colligative properties are Vapor pressure lowering Boiling point elevation Melting point depression Osmotic pressure © 2009, Prentice-Hall, Inc. Vapor Pressure Because of solute-solvent intermolecular attraction, higher concentrations of nonvolatile solutes make it harder for solvent to escape to the vapor phase. © 2009, Prentice-Hall, Inc. Raoult ' s Law $P_A = X_A P_A^0$ A where X_A is the mole fraction of compound A, and P_A^0 is the normal vapor pressure of A at that temperature.

Colligative Properties of Ionic Solutions Colligative properties of solutions depends upon the total concentration of particles. Each equation describing colligative properties must be modified to account for this with ionic solutions since each ionic compound gives more than one mole of ions for every mole of compound.

Colligative Properties. The properties of the solutions which depend only on the number of solute particles but not on the nature of the solute are called Colligative properties. The four important colligative properties are: (i) Relative lowering in vapour pressure (ii) Elevation in boiling point (iii) Depression in freezing point (iv) Osmotic pressure.
