Combinatorics is the study of finite sets of objects defined by certain specified properties ∪ combinatorial structures ∪ such as: ∪ subsets of a finite set ∪, {1}, {2}, {3}, {1, 2}, {1, 3}, {2, 3}, {1, 2, 3} ∪ Partitions of a number 4 = 1+1+1+1 = 1+1+2 = 1+3 = 2+2. ∪ Words over a finite alphabet aaa, aab, aba, abb, baa, bab, bba, bbb.

The problem occupies a rare position in the world of complexity theory, it is clearly in NP but is not known to be in P and it is not known to be NP-complete. Many sub-disciplines of mathematics, such as topology theory and group theory, can be brought to bear on the problem, and yet only for special classes of graphs have polynomial-time algorithms been discovered.
