Cutaneous Soft Tissue Tumors – LWW Official Store

Superficial, especially cutaneous soft tissue tumors deserve attention because of their special biology, often with better prognosis than their deep counterparts.

[Cutaneous and subcutaneous soft tissue tumors]:

Epidemiology. Incidence depends entirely on the specific tumor with intramuscular myxoma being the most common 2,3 from the benign lesions. Aggressive angiomyxoma is a locally aggressive benign variant affecting mostly women 2,3. Fairly frequent malignant myxoid tumors include myxoid liposarcoma making up 20-50% of all liposarcomas 3, myxofibrosarcoma, formerly known as myxoid malignant fibrous histiocytoma, which is a common malignant soft tissue tumor in the elderly 3.

Myxoid soft tissue tumors | Radiology Reference Article –

The most common subcutaneous malignant soft-tissue tumor is the superficial variant of malignant fibrous histiocytoma. Malignant fibrous histiocytoma is the most common mesenchymal malignancy and accounts for approximately 24% of all soft-tissue sarcomas (, 3), with about 7%–10% of occurrences being confined to the subcutis, and there is typically no fascial involvement (, 4 , , 5).

Superficial Soft Tissue Masses: Analysis, Diagnosis, and –

Soft tissue giant cell tumors are occasionally found in horses. The majority occur in the hind limbs of older horses. Soft tissue giant cell tumors are sarcomas of possible malignancy. They seldom spread but tend to return after surgical removal. Surgical removal is the normal recommended treatment for these tumors.

Pathology Outlines – Soft tissue

What is a soft tissue sarcoma? Soft tissue sarcomas are a group of malignant cancers that arise from the skin and subcutaneous connective tissues, such as fat, muscle, cartilage, fibrous connective tissue, nerves and the "pericytes" of small blood vessels in the subcutis. These tumors are often considered collectively because of their similarity in clinical behavior. Soft tissue sarcomas may arise from any site.

Soft Tissue Sarcoma in Dogs » Small Animal Hospital –

This comprehensive, yet user friendly, volume specifically focuses on cutaneous soft tissue tumors, one of the most challenging areas in dermatopathology. The text is richly illustrated and written in a user friendly fashion, by well-known experts in cutaneous soft tissue tumors, with an emphasis on a practical diagnostic approach.

Soft Tissue Tumors of the Skin | SpringerLink

A soft tissue sarcoma is a cancer of connective tissue in the body. Connective tissue is the building block of the skeleton and includes tissues such as muscle, bone, tendon, ligament, blood vessels, nerves and the fibrous glue that holds all of these together.

Soft Tissue Sarcoma – Fitzpatrick Referrals

Sites: cutaneous or subcutaneous tissue and particularly trunk, mammary glands, limbs, and head Pseudoencapsulated soft to firm tumors with poorly defined histologic margins or infiltrate through and along fascial planes and are locally invasive Local recurrence after conservative surgery is common

Skin STS – VSSO

Cutaneous and subcutaneous soft tissue tumours have been rarely described in detail in snakes. Several malignant entities show strikingly similar histological patterns and therefore the term soft tissue sarcoma (STS) has become a standard histopathological diagnosis. The present study characterizes soft tissue tumours in 33 snakes.

Cutaneous and Subcutaneous Soft Tissue Tumours in Snakes –

In the 2018 World Health Organization Classification of Skin Tumors, a wide range of predominantly benign mesenchymal neoplasms are included in the fibroblastic, myofibroblastic, and "fibrohistiocytic" categories. By far the most common of these tumors is dermatofibroma (fibrous histiocytoma).
