Tooth decay, also known as dental caries or cavities, is a breakdown of teeth due to acids made by bacteria. The cavities may be a number of different colors from yellow to black. Symptoms may include pain and difficulty with eating.

[Tooth decay - Wikipedia](#)

What are dental caries? Dental caries are also called cavities. Cavities are caused by bacteria. The bacteria mix with carbohydrates from foods and create acids. The acids break down areas of enamel, which covers the outside of a tooth. This creates a small hole in the tooth called a cavity.

[Dental Caries - What You Need to Know - Drugs.com](#)

Tooth decay (dental caries) is damage to a tooth that can happen when decay-causing bacteria in your mouth make acids that attack the tooth's surface, or enamel. This can lead to a small hole in a tooth, called a cavity. If tooth decay is not treated, it can cause pain, infection, and even tooth loss.

Dental caries, which is also referred to as tooth decay or cavities, is one of the most common and widespread persistent diseases today and is also one of the most preventable. When you eat certain foods, the bacteria on your teeth breaks them down and produces acids that have the ability to seriously damage the hard tissues of your tooth. The result is the formation of dental caries (cavities).
