The design of foundation systems is an engineering process which therefore involves a simplistic modelling of the more complex real world. With reference to pile foundations, pile design always involves calculation of the axial bearing capacity of the single pile.

A Local Design Method for Pile Foundations
Since we know the applied loads, effective length, and pile diameter, we can design the pile using a conventional method or using a software. Key factors to be considered in the

The design and analysis of deep foundations such as piles is somehow a form of art because of all the uncertainties involved in interpreting geotechnical data. Although numerous theoretical and experimental approach was conducted to analyze the behaviour and estimate the load-carrying capacity of piles in various soil types, but yet, we still have a lot to understand on the mechanism of piles foundation.

Design Considerations using Piles We all know that piles or a group of piles are used to support a pile cap. For this to work, we have to provide a “support” for specified locations. This support can be interpreted as a “pin support”, but doing so will give as a very conservative result.
