Higher concentrations of l-carnitine, fchol, and TMAO were found in those women who had more western-style dietary patterns. Nor choline or betaine intake affected plasma fchol, TMA, or TMAO. BMI was positively correlated with fchol and TMA. tHcy was positively correlated with fchol, TMA, and TMAO, while fchol was also positively correlated with TMA and TMAO.

Dietary, anthropometric, and biochemical factors ---

The objective of the study was to evaluate the nutritional, anthropometric, and biochemical factors that influence choline, l-carnitine, trimethylamine (TMA), and trimethylamine-N-oxide (TMAO) metabolism in elderly women. The volunteers' diet was assessed using a food frequency questionnaire.

Dietary, anthropometric, and biochemical factors ---

Dietary, anthropometric, and biochemical determinants of uric acid in free-living adults Abstract. High plasma uric acid (UA) is a prerequisite for gout and is also associated with the metabolic syndrome and... Introduction. Uric acid (UA) is a waste product of the human purine balance. It is formed ...

Dietary, anthropometric, and biochemical determinants of ---

Dietary, anthropometric, and biochemical factors ... The objective of the study was to evaluate the nutritional, anthropometric, and biochemical factors that influence choline, l-carnitine, trimethylamine (TMA), and trimethylamine-N-oxide (TMAO) metabolism in elderly women. The volunteers' diet was assessed using a food frequency questionnaire.

Dietary Anthropometric And Biochemical Factors

However, after the adjustments for gender, age, BMI, and total energy intake (TEI) the higher CHO intake was the only dietary risk factor found for abnormal HDL-c. Many recommendations have been provided to the public to reduce dietary fat, with some claims that health benefit will be achieved . However in human studies when total fat is replaced by carbohydrate intake, the result is a decreased plasma concentration of fasting HDL-c and elevated triglycerides, which may counteract the ...

Dietary, Anthropometric, and Biochemical Determinants of ---

Objective: To assess anthropometric and biochemical assessment of nutritional status and dietary intake in children, their relationship with socioeconomic factors and georeferencing. Methods: Cross-sectional study in schoolchildren aged 6-14 years from the District of General Pueyrredon, during August-November 2013. Dietary intake was assessed using a 24-hour dietary recall interview, and georeferencing was done using the gvSIG software.

Anthropometric and biochemical assessment of nutritional ---

Anthropometric and biochemical measurements are important factors for determining the health status of an individual. These are also used to diagnose chronic illness [1]. Some previous studies confirmed the impact of socio-demographic characteristics and dietary habit on the health status [2].
