8VSB is the modulation method used for broadcast in the ATSC digital television standard. ATSC and 8VSB modulation is used primarily in North America; in contrast, the DVB-T standard uses COFDM. A modulation method specifies how the radio signal fluctuates to convey information. ATSC and DVB-T specify the modulation used for over-the-air digital television; by comparison, QAM is

ATSC is the digital HD TV standard used within the United States and Canada. It is 6 MHz wide so the RTL-SDR with its maximum bandwidth of about 2.8 MHz cannot decode this signal. However, higher end SDR's such as the SDRplay, Airspy and HackRF have larger bandwidths that can easy cover 6 MHz. One SDRplay owner was able to figure out a way to decode ATSC by using a

MN88436 - Socionext

An ATSC tuner, often called an ATSC receiver or HDTV tuner, is a type of television tuner that allows reception of digital television television channels that use ATSC standards, as transmitted by television stations in North America, parts of Central America, and South Korea. Such tuners are usually integrated into a television set, VCR, digital video recorder, or set-top box which provides audio/video output connectors of various types. Another type of television tuner is a digital television
