This has made Plant Physiology the most authoritative, comprehensive, and widely used upper-division plant biology textbook. In the Sixth Edition, the Growth and Development section (Unit III) has been reorganized and expanded to present the complete life cycle of seed plants from germination to senescence. In recognition of this enhancement, the text has been renamed Plant Physiology and Development. As before, Unit III begins with updated chapters on Cell Walls and Signals and Signal ...

Chloroplasts are dynamic organelles within the plant cell. Movement of entire chloroplasts to maximize light absorption was observed long ago by light microscopy (see textbook, Figure 9.14). Chloroplasts are surrounded by an envelope membrane, which sometimes appears to circulate around the main body of the organelle.

Topic 4.4 Leaf Transpiration and Water Vapor Gradients. Transpiration from the leaf depends on two major factors: the difference in water vapor concentration between the leaf air spaces and the the external air and, the diffusional resistance (*r*) of this pathway. This concept of transpiration is analogous to the flow of electrons in an electric circuit.

The pH in the cytosol of plant cells is around 7.5, and the homogenate should be buffered at pH 7–8. A buffer should therefore be included and a plethora of different buffers are available. Choose an inexpensive one with a pKa of 7–8 (e.g., 4-morpholinopropane sulfonic acid [MOPS]) and be sure to use enough to counterbalance the acidic vacuolar content.

The upper mature leaves on a plant usually provide photosynthates to the growing shoot tip and young, immature leaves; the lower leaves supply predominantly the root system. Intermediate leaves export in both directions, bypassing the intervening mature leaves. The importance of various sinks may shift during plant development.
