10 ENGINEERING NOISE CONTROL - WHO

The practice of engineering noise control demands a solid understanding of the fundamentals of acoustics, the practical application of current noise control technology and the underlying theoretical concepts. This fully revised and updated fourth edition provides a comprehensive explanation of these key areas clearly, yet without oversimplification.

Since the late 1940s, scientists and engineers have been working on ways to control noise from machinery. In the 1970s, the emphasis was on engineering controls in the workplace, but since then the focus has shifted because OSHA has not enforced the requirement for engineering controls and because industry leaders have failed to take into account the

Noise control engineering is concerned with the application of basic acoustics and vibration theory to reduce noise in practical situations. The noise control engineer needs to know how to set targets, how to characterise and quantify noise sources, and how to reduce noise either at source or, more commonly, in the transmission path.

One of the first means of engineering controls is to interrupt the path of the noise from the source to the worker. This is best achieved where higher frequencies are involved by blocking the path through acoustical insulation that is effective for a specific frequency range.

The exposure to noise can be reduced by eliminating the source of noise (if possible), substituting the source with a quieter one, applying engineering modifications, using administrative controls, and by using protective equipment. The best way to reduce exposure to noise is to engineer it out at the design stage.
