The aim of environmental chemistry is to understand how the earth, including its liquid and gaseous outer skins of hydrosphere and atmosphere, operates as a chemical system [1]. This approach draws upon established principles in the parent discipline of pure chemistry, although it is readily apparent that the earth is a complex system which cannot be described in chemical terms alone.

Air pollution and global warming, as most scientists agree, seem to go hand in hand. The main component of this is the greenhouse gas, carbon dioxide. Carbon Dioxide is a necessary gas for our survival. They call it a greenhouse gas because it makes the Earth habitable by blocking some of the sun's radiation from exiting the atmosphere.

Environmental Chemistry publishes manuscripts addressing the chemistry of the environment (air, water, earth, and biota), including the behaviour and impacts of contaminants and other anthropogenic disturbances. The scope encompasses atmospheric chemistry, geochemistry and biogeochemistry, climate change, marine and freshwater chemistry, polar chemistry, fire chemistry, soil and sediment chemistry, and chemical aspects of ecotoxicology.
