The challenges of designing FPGA-based systems are twofold. The first revolves around the FPGA itself: i.e., choosing the right FPGA for the design needs, and maximizing the use of FPGA resources. The second dimension has to do with FPGA-PCB co-design, which involves ensuring that pin-assignment is optimized for the PCB.

Field-programmable gate array prototyping (FPGA prototyping), also referred to as FPGA-based prototyping, ASIC prototyping or system-on-chip (SoC) prototyping, is the method to prototype system-on-chip and application-specific integrated circuit designs on FPGAs for hardware verification and early software development.

~~FPGA prototyping — Wikipedia~~

A field-programmable gate array (FPGA) is an integrated circuit designed to be configured by a customer or a designer after manufacturing - hence the term "field-programmable". The FPGA configuration is generally specified using a hardware description language (HDL), similar to that used for an application-specific integrated circuit (ASIC). Circuit diagrams were previously used to specify ...
