Ion exchange is a common industrial method of water softening. It is accomplished by passing the water through columns of a natural or synthetic resin that trades sodium ions for calcium and magnesium ions. After the column has been in use for some time, calcium and magnesium begin to appear in the water leaving the column.

water softening: $2RNa^+ + Ca^{2+} \rightarrow R_2Ca^{2+} + 2Na^+$ The exchanger R in the sodium ion form is able to exchange for calcium and thus, to remove calcium from hard water and replace it with an equivalent quantity of sodium.

Subsequently, the calcium loaded resin may be treated with a sodium chloride solution, regenerating it back to the sodium form, so that it is ready
