Self Potential Anomalies and their Minerological Implications, A Case Study of Some Parts Geophysical Investigations For Groundwater In Groundwater Geophysics. Applying geophysics for groundwater exploration and/or resource evaluation is only about 10 to 15 years in practice. The ever-increasing need for groundwater has translated into using subsurface imaging to meet the demand. Generally speaking, the methods applied to find groundwater are very similar to those used for natural resource exploration; for example, mineral or petroleum products.

In the environmental assessment of contaminated areas, conducting geophysical surveys has the basic objective identification of the presence of groundwater contamination and the definition of the geological and hydrogeological features of the investigated sites. The characteristics of the geological environment, and the nature of the contamination, can determine the behavior of contaminants in the subsurface.
