Gout and Hyperuricemia - American
Family Physician

Summary. Gout is a common inflammatory arthropathy characterized by painful and swollen joints resulting from precipitating uric acid crystals. Decreased renal excretion and/or increased production of uric acid leads to hyperuricemia, which is commonly asymptomatic, but also predisposes to gout. Acute gout attacks typically manifest with a severely painful big toe (podagra) and

Gout is a disorder caused by hyperuricemia (serum urate > 6.8 mg/dL [> 0.4 mmol/L]) that results in the precipitation of monosodium urate crystals in and around joints, most often causing recurrent acute or chronic arthritis. The initial attack (flare) of gout is usually monarticular and often involves the 1st metatarsophalangeal joint.

The presence of calcium oxalate stones is 10–30 times higher in gout patients than those without gout. 25 Deposits of monosodium urate crystals in kidney tissues can result in kidney damage (nephropathy), either acutely by formation of crystals within the tubules of the kidney, or through a chronic inflammatory response to urate deposits in other tissues of the kidney. 26 Prior to the development of uric acid lowering treatments, kidney disease occurred in up to 40%
