If w has an odd number of 1's, then so does z . By the inductive hypothesis, $\hat{\delta}(A, z) = B$, and the transitions of the DFA tell us $\hat{\delta}(A, w) = B$. Thus, in this case, $\hat{\delta}(A, w) = A$ if and only if w has an even number of 1's. Case 2: $a = 1$. If w has an even number of 1's, then z has an odd number of 1's.

Let n be the pumping-lemma constant and consider string $z = a^n b^{n+1} c^{n+2}$. We may write $z = uvwxy$, where v and x , may be "pumped," and $|vwx| \leq n$. If vwx does not have c 's, then uv^3wx^3y has at least $n+2$ a 's or b 's, and thus could not be in the language.

Using Exercise 2.2.2, $\hat{\delta}(q_0, x^k) = \hat{\delta}(\hat{\delta}(q_0, x^{k-1}), x) = \hat{\delta}(q_f, x)$ [by the inductive hypothesis] = q_f [by (a)].

Exercise 2.2.10. The automaton tells whether the number of 1's seen is even (state A) or odd (state B), accepting in the latter case.
