An object-relational database ( ORD ), or object-relational database management system ( ORDBMS ), is a database management system (DBMS) similar to a relational database, but with an object-oriented database model: objects, classes and inheritance are directly supported in database schemas and in the query language.

~~Object relational database - Wikipedia~~

An object-relational database (ORD) is a database management system (DBMS) that's composed of both a relational database (RDBMS) and an object-oriented database (OODBMS). ORD supports the basic components of any object-oriented database model in its schemas and the query language used, such as objects, classes and inheritance.

The object-relational model allows users to define new sets of data types and models drawn from the object programming languages. This means you can create persistent objects [1] within the database and access them through an API (application programming interface) from C++, Java, and other programming languages.

Introduction. Databases in Access are composed of four objects: tables, queries, forms, and reports. Together, these objects allow you to enter, store, analyze, and compile data however you want. In this lesson, you will learn about each of the four objects and come to understand how they interact with each other to create a fully functional relational database.

An Object relational model is a combination of a Object oriented database model and a Relational database model. So, it supports objects, classes, inheritance etc. just like Object Oriented models and has support for data types, tabular structures etc. like Relational data model.

## ~~Object-relational Data Model - Tutorialspoint~~

An RDBMS that implements object-oriented features such as user-defined types, inheritance, and polymorphism is called an object-relational database management system (ORDBMS). Oracle Database has extended the relational model to an object-relational model, making it possible to store complex business models in a relational database.

## ~~Introduction to Oracle Database~~

A relational database is a database that stores data in tables that consist of rows and columns. Each row has a primary key and each column has a unique name. A file processing environment uses the terms file, record, and field to represent data. A relational database uses terms different from a file processing system.
