~~The following simple code shows how we can create an instance of a discriminator and train it to output a target of 1.0. You can see we're training it 300 times. # create Discriminator D = Discriminator() # train Discriminator for i in range(300): # train discriminator on true D.train(generate\_real(), 1.0) pass~~

~~Normally we use p5js to create 2-d shapes like lines, rectangles and circles, painted onto a canvas. We can also use p5js to create 3-d objects and move them in 3-d space. To do that p5js uses WebGL, a technology designed for efficiently rendering 3-d objects using a GPU in your computer if there is one. Lots of computer games use the same approach, taking advantage of the specially designed chips inside your computer or laptop.~~

~~We simply create an evenly spaced list of numbers, from 1.1 to 9.9, spaced every 0.1. We then calculate  $\zeta(s)$  for all these values of  $s$ , and plot a graph. We could have hand-coded our own function to work out  $\zeta(s)$  by summing, say the first 10 or 100 terms in the series, but we can use the convenience function provided by the popular mpmath library.~~
