Grover's algorithm is a quantum algorithm that finds with high probability the unique input to a black box function that produces a particular output value, using just $O(\sqrt{N})$ evaluations of the function, where N is the size of the function's domain. It was devised by Lov Grover in 1996. The analogous problem in classical computation cannot be solved in fewer than $O(N)$ evaluations (because, in the ...

Grover's algorithm demonstrates this capability. This algorithm can speed up an unstructured search problem quadratically, but its uses extend beyond that; it can serve as a general trick or subroutine to obtain quadratic run time improvements for a variety of other algorithms. This is called the amplitude amplification trick.

Grover's Algorithm - Qiskit

Devised by Lov Grover in 1996, Grover's Algorithm provides an incredible speedup from its classical counterpart. It's a searching algorithm that allows us to find a certain element in its...

Grover's algorithm leads to the following theorem: Theorem 2.2. The unstructured search problem can be solved in $O(\sqrt{N})$ queries using quantum computation. In fact, this is within a constant factor of the best we can do for this problem under the quantum computation model, i.e. the query complexity is $\Theta(\sqrt{N})$ [BBBV97].

Since you understand the 2-qubit Grover's Algorithm now, it's quite easy to scale up to 3-qubits. Firstly, regarding the oracle, there is a CCZ gate which has a matrix $\begin{bmatrix} 1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 1 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 1 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 \end{bmatrix}$
