Also multiple sclerosis is known as a multifactorial disease, and is many times referred to as such in the medical literature. My question is why doesn't anyone here really discuss those other factors? Such issues as widespread mitochondrial dysfunction. Or the ongoing findings of previously unknown sophisticated and influential connections . . .

Q& A July - Multiple Sclerosis Research Blog

Multiple sclerosis (MS) is a condition that affects your brain and spinal cord. In MS, the coating that protects your nerves (myelin) is damaged. This causes a range of symptoms like blurred vision and problems with how we move think and feel. Once diagnosed, MS stays with you for life, but treatments and specialists can help you to

Online Library Multiple Sclerosis Q And A Reuring Answers To Frequently Asked Questions

What is MS? | Multiple Sclerosis Society UK

Multiple sclerosis (MS) is an autoimmune reaction, when your immune system attacks your own cells. But doctors don't know exactly why some people develop the condition. Having a certain combination of genes may make you more likely to develop MS. But the risk of developing MS if someone in your family has it is very small.
