A partial differential equation (PDE) is an equation involving an unknown function of more than one variable and certain of its partial derivatives. The order of a PDE is the order of the highest order partial derivative of the unknown appearing within it.

In mathematics, a partial differential equation is an equation which imposes relations between the various partial derivatives of a multivariable function. The function is often thought of as an "unknown" to be solved for, similarly to how  $x$  is thought of as an unknown number, to be solved for, in an algebraic equation like  $x^2 + 3x + 2 = 0$ . However, it is usually impossible to write down explicit formulas for solutions of partial differential equations. There is,

Definition 0.1. A partial differential equation (pde) is an equation involving an unknown function and its partial derivatives. In general, we need further information in order to solve a pde: for example, consider the Poisson equation  $\Delta u(x) = f(x)$ , for  $x \in \mathbb{R}^2$ , say. We also specify boundary conditions (bcs), for instance of ...

~~Partial Differential Equations — T.J. Sullivan~~

This text gives a comprehensive survey of modern techniques in the theoretical study of partial differential equations (PDEs) with particular emphasis on nonlinear equations. The exposition is divided into three parts: 1) representation formulas for solutions, 2) theory for linear partial differential equations, and 3) theory for nonlinear partial differential equations.

Partial differential equations also play a central role in modern mathematics, especially in geometry and analysis. The availability of powerful computers is gradually shifting the emphasis in partial differential equations away from the analytical computation of solutions and toward both their numerical analysis and the qualitative theory.

Consulting Partial Differential Equations by Evans, there is a more rigorous definition of the solution to a partial differential equation (page 7): We say that a given problem for a partial differential equation is well-posed if the problem in fact has a solution, this solution is unique, and
