Look at the time-independent Schrodinger equation, $\nabla^2 \psi + V_0 \psi = E \psi$. (1) Since the potential has an infinite jump in it, ψ will be continuous, but ψ' may have a finite jump. To see how big the ψ' jump is, integrate (1) from $x = 0^-$ to $x = 0^+$ to get $-2m \int_0^0 \psi' dx + V_0 \psi(0) = E \int_0^0 \psi dx$.

Solutions for R. Shankar: Principles of Quantum Mechanics I got this book in my 3rd year of uni when a certain QM course was destroying my life. It seems to strike a good middle ground between being too mathematically simplified (Griffiths) and incomprehensible for beginners (pretty much every other text I tried to read back then).
