 ca = sin(c) .\* (symsI/50);cb = cos(c) .\* (symsQ/50); We implement our phase shifting by passing the carrier vector cthrough either sinor cos. Additionally, we apply some attenuation to our analogue signals to prevent them from making our carrier too large - we'll do the inverse during the demodulation.

 An OFDM carrier signal is the sum of a number of orthogonal subcarriers, with baseband data on each subcarrier being independently modulated commonly using some type of quadrature amplitude modulation (QAM) or phase-shift keying (PSK). This composite baseband signal is typically used to modulate a main RF carrier.

Orthogonal frequency-division multiplexing - Wikipedia  
 A quadrature amplitude modulation (QAM) system is a communication system capable of transmitting two messages m1 ( t ), m2 ( t ) at the same time. The transmitted signal s ( t ) is. s(t) = m1(t) cos( ct ) + m2(t) sin( ct) Carefully draw a block diagram for the QAM system.

Quadrature Amplitude Modulation - an overview ...  
 Quadrature amplitude modulation (QAM) is the name of a family of digital modulation methods and a related family of analog modulation methods widely used in modern telecommunications to transmit information. It conveys two analog message signals, or two digital bit streams, by changing (modulating) the amplitudes of two carrier waves, using the amplitude-shift keying (ASK) digital modulation ...
