Presumably, the current stock value reflects the risk, timing and magnitude of all future cash flows, both short-term and long-term. If this is correct, then the statement is false. Solutions to Questions and Problems 1. The constant dividend growth model is:  $P_t = D_t \times (1 + g) / (R - g)$  So the price of the stock today is:  $P_0 = D_0 (1 + g) / (R - g)$

Stock valuation is the process of determining the intrinsic value of a share of common stock of a company. There are two approaches to value a share of common stock: (a) absolute valuation i.e. the discounted cashflow method and (b) relative valuation (also called the comparables approach).. The purpose of stock valuation is to find the value of a common share which is justified by the company ...

~~Stock Valuation | Methods & Formulas~~

Stock valuation based on the dividend discount model typically takes one of three forms depending on what pattern we expect the dividends to follow. These three model variations are (1) the no-growth case, (2) the constant-growth case, and (3) the non-constant-growth (or supernormal-growth) case.
