Investigators in the UK and many countries are taught a variant of the same system as the basic investigative process- they assemble a list of all the persons (nominals) who could have committed the crime, assemble the evidence for and against them, and then eliminate nominals until they are left with the likely perpetrator, or prime suspect. It is only at that stage that ' evidence ' is assembled against an individual, and in fact the totality of the evidence can be processed and collated ...

The Basics of Investigating Forensic Science: A Laboratory ...
In this module students will investigate other technologies that forensic biologists have at their disposal to assist in the investigation of cases. Because of its importance in serious assault cases there will be a strong focus on bloodstain pattern analysis but other human tissues and body fluids will also be covered in detail, including: hair, skin cells, semen, saliva, urine and faeces.
