Upper motor neuron syndrome is the motor control changes that can occur in skeletal muscle after an upper motor neuron lesion. Following upper motor neuron lesions, affected muscles potentially have many features of altered performance including: weakness decreased motor control including decreased speed, accuracy and dexterity altered muscle tone – a decrease or increase in the baseline level of muscle activity decreased endurance exaggerated deep tendon reflexes including spasticity, and ...

Upper Motor Neuron Lesions: What They Are, Treatment

A practical guide for clinicians involved in the management of spasticity, this book covers all aspects of upper motor neurone syndrome from basic neurophysiology and measurement techniques to practical therapy and the use of orthoses. Surgical techniques are also covered, as well as the particular problems of management of spasticity in childhood.

The upper motor neuron extends from the cerebral cortex to the spinal cord. Damage to the upper motor neuron pathway results in group of symptoms called the upper motor neuron syndrome. The initial damage to the cerebral cortex causes flaccidity of the muscles of the contralateral side to the damage.

Abstract We present two patients with primary lateral sclerosis-like upper motor neuron disease accompanying subclinical Sjögren's syndrome. Both patients showed progressive spastic quadriparesis, but neither sensory involvement nor detrusor dysfunction was noted. Lower motor neuron signs were detected only in their late follow-up period.

Upper motor neuron diseases are a heterogeneous group of disorders in which a degeneration of motor neurons of the cortex and tronchoencephalic motor nucleus occurs. Clinically, these disorders are characterized by weakness, motor clumsiness, spasticity, and hyperreflexia.

Upper Motor Neuron - an overview | ScienceDirect Topics

An upper motor neuron lesion occurs in the neural pathway above the anterior horn cell of the spinal cord or motor nuclei of the cranial nerves. Conversely, a lower motor neuron lesion affects nerve fibers traveling from the anterior horn of the spinal cord or the cranial motor nuclei to the relevant muscle. Upper motor neuron lesions occur in the brain or the spinal cord as the result of stroke, multiple sclerosis, traumatic brain injury, cerebral palsy, atypical parkinsonisms, multiple system

Upper motor neuron lesion - Wikipedia

Motor neurone disease is an uncommon condition that mainly affects people in their 60s and 70s, but it can affect adults of all ages. It's caused by a problem with cells in the brain and nerves called motor neurones. These cells gradually stop working over time. It's not known why this happens.
